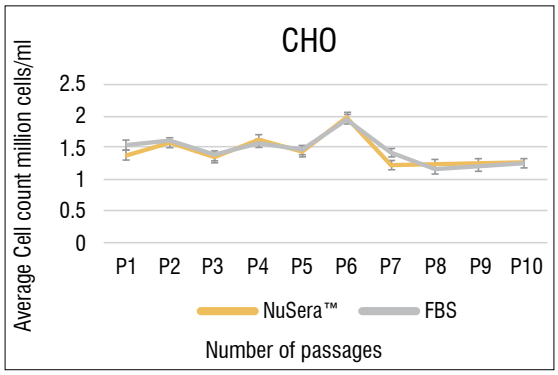
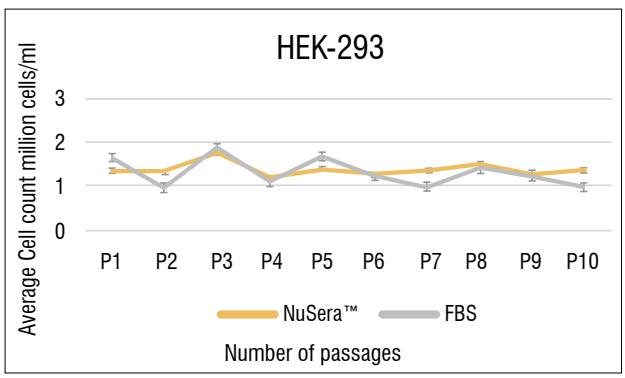
Long-term Proliferation

NuSera™ ensures sustained cell viability and proliferation over prolonged cell culture periods, supporting higher cell densities while maintaining optimal cell health. This makes it ideal for extended cell culture experiments.





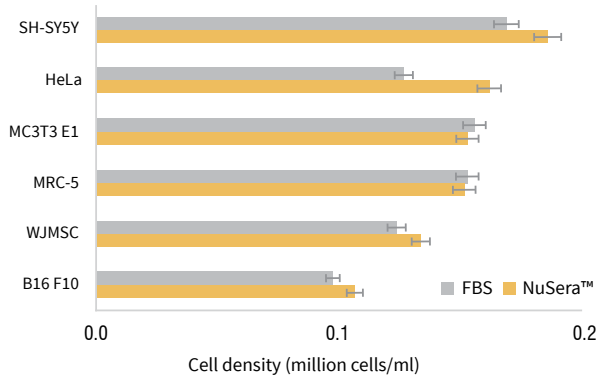
Long-term Proliferation in NuSera™ vs FBS

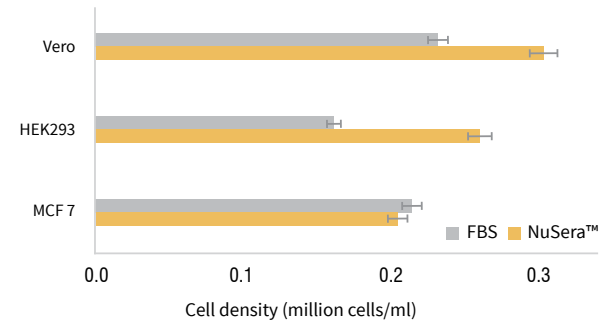
Long term proliferation ability of NuSera™ serum replacement solution was determined by maintaining CHO and HEK cells till passage 10. NuSera™ provide favorable conditions long-term proliferation of CHO & HEK-293 cells

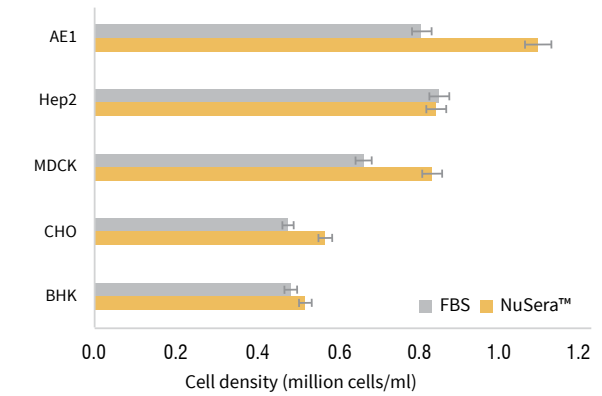
Growth Promotion

The bar graphs indicate that cell cultures supplemented with NuSera™ generally achieve equal or higher cell densities compared to FBS across multiple cell lines.

This suggests that NuSera™ supports superior or comparable cell proliferation making it a viable alternative to FBS.





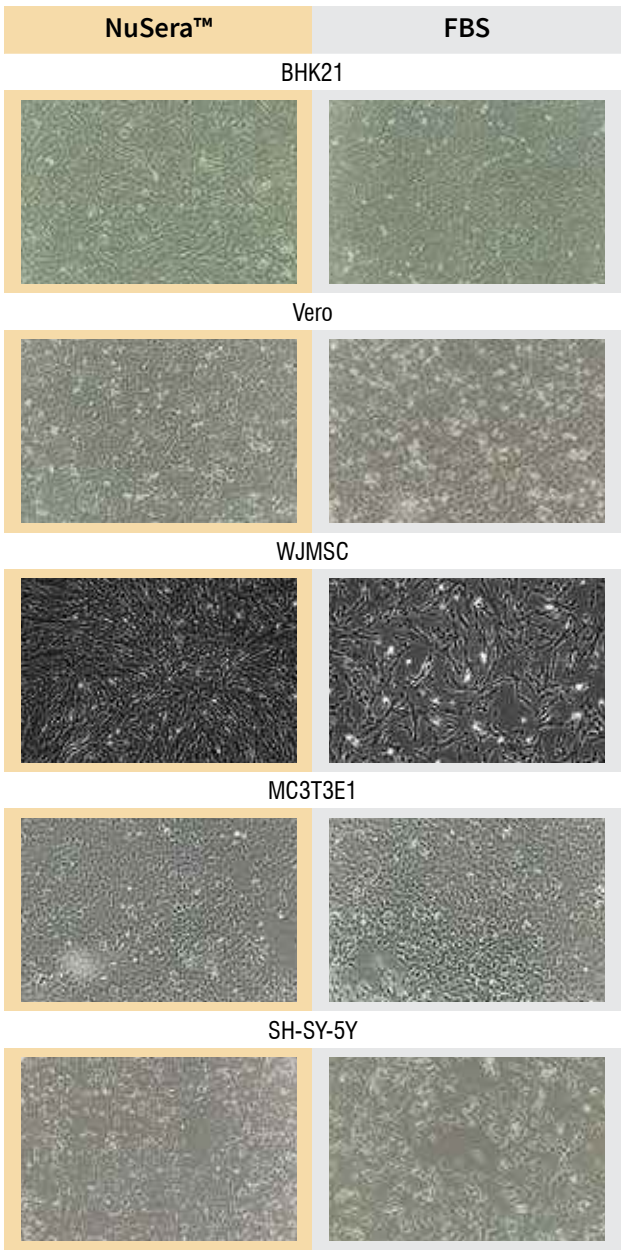


Growth promtion capacity of NuSera™ Vs FBS

Each cell line was seeded in 96WP at a fixed cell density, incubted at 37°C, 5 % CO_2. Cell density was determined after every 24 hours. Peak cell densities are represented in the graphs given above.

Cell Morphology

The phase contrast images show that the cells cultured with NuSera™ exhibit uniform growth and improved cell morphology, making it a potential replacement for FBS in cell culture applications.



Cell morphology in NuSera™ Vs FBS supplemented cultures

Phase contrast (10X) images of representative cell lines cultured in NuSera™ and FBS supplemented media.

Plating Efficiency

NuSera™ significantly improves plating efficiency, ensuring better attachment, uniform spread and higher viability leading to reproducible and high-quality results across various cell types.

Is it a “Waste of Time” to Heat Inactivate the Sera?

For the majority of cell culturists, the heat inactivation of serum should be a concern. Purchasing growth factors, vitamins, amino acids, and other costly items for thousands of rupees and then exposing them to temperatures at 56°C for at least half an hour would be unthinkable. This is precisely what happens in many cell culture labs, though.

The effects of this harsh treatment on growth hormones, vitamins, amino acids, and other substances are often overlooked by cell culturists who frequently heat inactivate serum products.

It has been estimated that at least 70% of all customers who heat inactivate serum do so only because it is part of their protocols or has long been considered essential.

In the past, it was thought that heat inactivation was required to eliminate heat-labile substances like complement. However, it appears that inactivating complement does not require heat inactivating FBS. Heat inactivation was thought to inactivate adventitious microbiological pollutants such mycoplasmas in addition to complement inactivation. In the past, mycoplasmas were occasionally isolated from serum and media products when serum was filtered using 0.45 micron pore-size graded filters. However, this issue was addressed and solved by passing serum through three successive 0.1 micron pore-size graded filters.

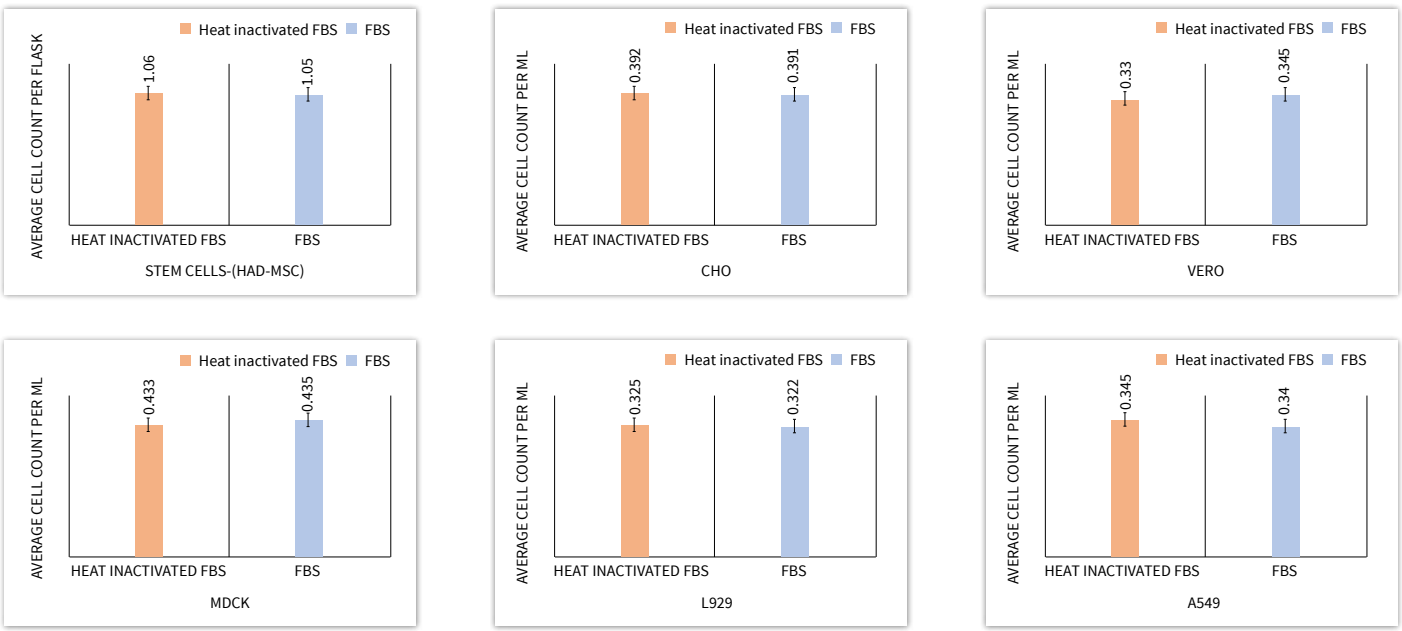
The continuous improvement and validation of contemporary filtering systems has reduced the necessity to use heat to deactivate mycoplasmas.

There are few published studies on the effects of heat inactivation on serum products, but the findings and customer feedbacks suggest that heat inactivation is not required for the majority of cell culture applications.

Pinyopummintr et al. discovered that heat inactivation is unnecessary for serum with high embryotrophic qualities, and that eliminating heat inactivation has no effect on bovine embryo growth in vitro.

As per the study conducted by researchers, heat inactivation negatively impacted the proliferation of the three cell lines Fig.3 (HEK293, HeLa, and HEP2). Heat inactivation had no effect on the proliferation six cell lines Fig.1 (CHO, MDCK, VERO, L929, A549, and HAD-MSC). Only two cell lines Fig.2 (AE-1 hybrid and MRC5) showed somewhat better performance in heat-inactivated serum. Thus, when done correctly, heat inactivation has little to no benefit for cell growth and typically leads to slower growth rates.

Figure 1



Heat inactivation of FBS: No effect on Stem cells (HAD-MSC), CHO, VERO, L929, A549 & MDCK

Untreated FBS

Fig 1 - No Observable Effect of Heat Inactivation:

Heat inactivation of fetal bovine serum does not affect the growth of CHO, MDCK, VERO, L929, A549, and HAD-MSC (human adipose-derived mesenchymal stem cells) cell lines, as evidenced by similar average cell counts per mL between treated and untreated conditions.

Figure 2

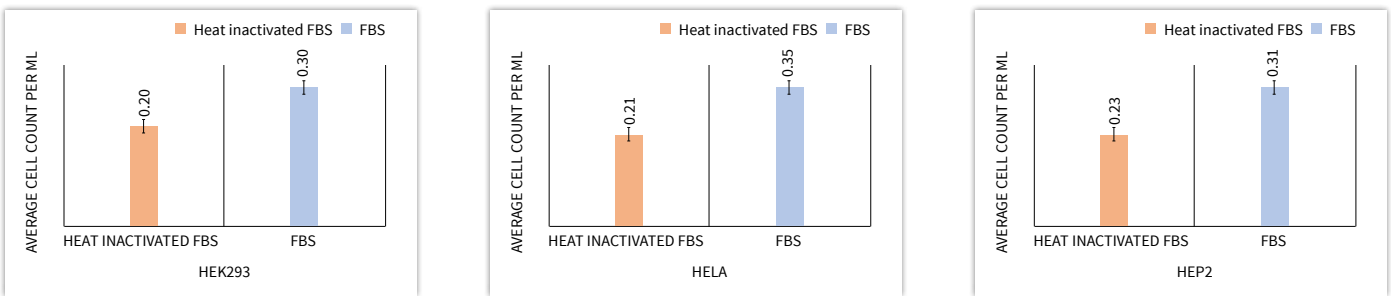
Heat inactivation of FBS: Slightly improved growth on AE-1 & MRC5

Untreated FBS

Fig 2 - Slight Improvement in Growth with Heat Inactivation:

Heat inactivation enhances the proliferation of AE-1 hybrid and MRC5 cell lines slightly, as indicated by an increased average cell count per mL in cultures with heat-inactivated fetal bovine serum compared to those with untreated FBS.

Figure 3



Heat inactivation of FBS: Negatively Impacted HEK293, HeLa & HEP2

Untreated FBS

Fig 3 - Growth Negatively Impacted by Heat Inactivation:

Heat inactivation significantly inhibits the proliferation of HEK293, HeLa, and HEP2 cell lines, as demonstrated by a reduced average cell count per mL in cultures supplemented with heat-inactivated fetal bovine serum (FBS) compared to those supplemented with untreated FBS.

Serum will nearly or always suffer when heat inactivation is done incorrectly, though. When serum products are heated, precipitates occur that are sometimes misidentified as microbiological contamination. After noticing this cloudiness, many cell culturists try to "culture" the bacterium by further incubating the entire bottle's contents at 37°C. Sadly, this makes things worse.

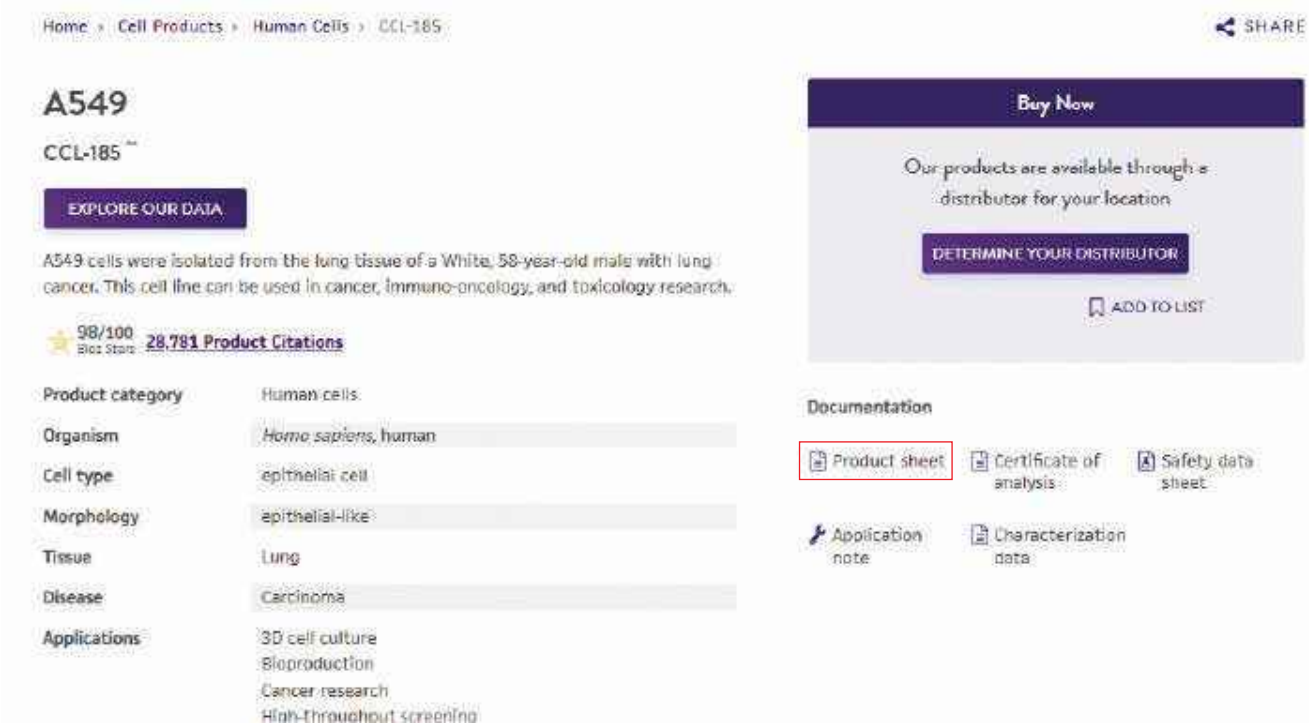
The difficulty is that extended incubation merely causes more precipitate to develop. This precipitate is so similar to a microbiological contamination that even expert microbiologists and cell culturists frequently fail to recognize the difference. The presence of a precipitate must be confirmed by extensive testing, including Gram staining, plating on bacterial growth media, and electron microscopy. Simply to persuade cell culturists that the serum is not tainted with microorganisms, these tests lead to a significant amount of time and resources.

Additionally, if serum is heat inactivated for longer than 30 minutes or at temperatures higher than 56°C, or if the contents of the container are not thoroughly mixed, precipitates are more likely to form.

In conclusion, heat inactivation of serum is not necessary for the majority of cell culture applications. Heat inactivation typically has negative consequences and does not enhance the serum's capacity to promote growth. Furthermore, precipitates that are commonly confused for microbiological contaminants are more likely to form as a result of heat inactivation. In addition to causing needless worry, this uses up important resources for both the supplier and the user.

Consumers who now heat-inactivate their serum should assess whether their specific cell lines or culture systems require this process. You can use the below steps to asses whether your cell line requires heat Inactivation or not

1. Go to ATCC website and find the cell line you wish to know about
   Link: https://www.atcc.org/
2. Download the Product Sheet



3. Please refer to the category “Complete Medium” & refer to the components. Please use the serum recommended in this section.

Cellulose Acetate Membranes

Standard Cellulose Acetate Membranes

- Cellulose acetate membrane exhibit low protein binding capacity.
- They are hydrophilic making them suitable for aqueous and alcoholic media.
- Shows improved solvent resistance and high thermal stability with very low adsorption characteristics.
- Ideally suited for general filtration and biological/clinical analysis requiring maximum protein recovery.

Applications

- Filtration of Aqueous Solutions.
- Air/Gas Filtration
- 3 μm, 5 μm - Particle monitoring (Automotive machines)

HiFlo™ Pump

AI0014

Maximise your workspace environment by eliminating the need for separate manifold, vacuum pump and excess tubing and improve operation time

Save 70% bench space

Easy Operation & Versatile

Compatible with HiMedia SS/PP/ PSU funnel

Introduction

The Membrane Filter (MF) Technique is a method of analyzing aqueous samples for microbial contamination. A fluid sample is pulled through a membrane filter and the filter is placed on growth media and incubated. After the prescribed incubation period, colonies are counted and reviewed for appropriate morphology. HiFlo™ Pump is ideal for microbiological evaluations of aqueous samples by MF Technique. This simple, compact unit will optimize and maximize your workspace environment by eliminating the need for separate manifold, vacuum pump, and excess tubing. The HiFlo™ is designed to use Diaphragm Based Self priming action to draw the sample through the filter and send filtrate directly to drain or waste collection. Operating parameters are preset and fixed to best satisfy requirements for MF Technique described in EPA, ISO, and ASTM methods; thereby providing conditions comparable to a standard manifold set-up.

CASY TON
Isotonic measurement buffer

FEATURES

Label-free cell status, instantly.

Within seconds, measurement is performed non-invasively without using distorting dyes.

Statistically relevant data

Analysis of more than 4,000 cells per run enables statistically significant results.

Get the full picture

CASY quantifies all relevant parameters of cells including cell viability, cell size and aggregation – at extremely low running costs.

HOW IT WORKS

Counting Cells in just Seconds

Cells suspended in CASYton, a conductive isotonic buffer solution, are drawn through a measuring pore. This pore is defined in size and housed inside the capillary which separates two platinum electrodes, the inner and outer electrode. Here, a low voltage field is cycling with 1 MHz. Each cell or particle passing the measuring pore generates an individual electrical pulse by displacing buffer electrolyte in the measuring pore. This pulse is measured as a cell count.

Cell Viability – Keep Tabs on Membrane Degradation

As CASY takes the whole pulse area into account, including amplitude and pulse width, high resolution measurements are enabled, allowing to detect slightest changes of the cell membrane's electrical properties. The permeable membrane of dying and dead cells thus allows to identify dead cells by a change in electrical resistance, finally indicating the size of the nucleus.

Accurate Cell Volume

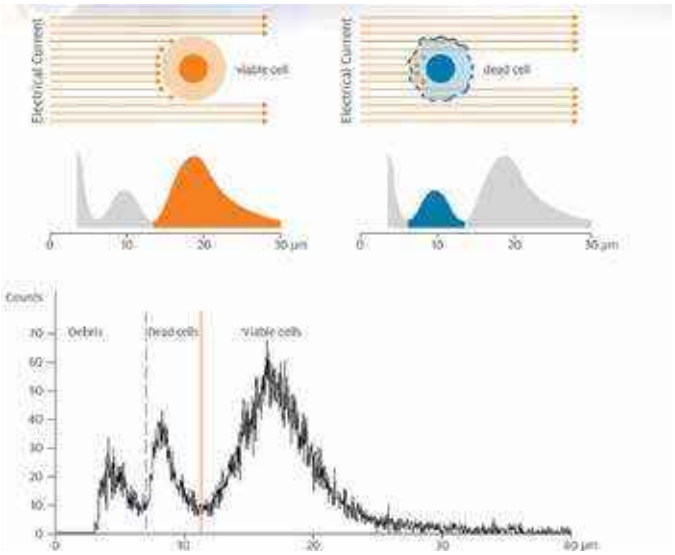
The combination of amplitude and width of the electrical pulse is proportional to the individual volume of the cell or particle passing the pore. Thus, cell volume can be directly deduced from the change in electrical resistance.

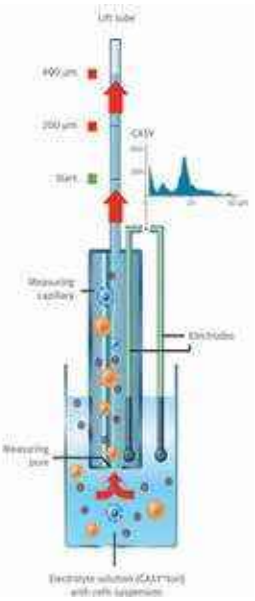
Biomass & Cell Aggregation – The True Cell Count

Biomass concentration and cell aggregation are essential parameters in any cell culture- and fermentation setting. CASY's measuring principle, including accurate cell volume determination, enables CASY to calculate aggregate volumes. This delivers extremely precise and reliable information on biomass content and aggregation status of your cells in culture. Furthermore, by taking account of cells hidden in aggregates, the true cell count is determined. Thereby drastically improving the accuracyof counting results.

Cell Debris and the »Comfort Zone« of Your Cells

Cellular debris may dramatically influence cell-based assays and its absence is an excellent indicator verifying that your cells are in the »comfort zone«. The huge dynamic size range of each CASY measurement provides you with a significant criterion for the usability of the cells in any critical followup experiment – at a single glance. And it does so quickly: typical measurement time of mammalian cells is around 10 seconds.





Biomass-determination or aggregates?

CASY delivers accurate volumes

High-frequency scanning of objects and the high dynamic measuring range, enable CASY to precisely measure volumes of cells or objects. Thus, cell aggregates and the entire biomass content of each sample are immediately available.

Accurate total cell count includes aggregates

Mathematically breaking down aggregates into single cells, CASY optionally counts all cells hidden in aggregates – and thus provides an accurate total cell count.

No limits. CASY measures cell lines, primary cells, bacteria, yeast, algae, parasites… – you name it

With a detection range of 0.7 – 120 μm, CASY measures all types of mammalian cells and stem cells, as well as bacteria, yeast, algae, parasites, pollen, sperm and more. Any particle in the size range might be measurable – and a lot of various samples have been readily measured.

Introducing
NEW BUFFER SOLUTIONS RANGE

HiMedia buffer solutions are high-quality chemical standards specifically designed for the precise calibration, qualification, and monitoring of pH measuring instruments and electrodes. These solutions are formulated to maintain a stable pH value, resisting changes even when small amounts of acids or bases are introduced. Typically available in values such as pH 4.0 , pH 7.0 , and pH 10.0. Himedia buffers are essential for establishing a reliable baseline for any electrochemistry application.

Non Traceable buffer solutions

Product Name	Code	Pack size	Rate
pH buffer 4.0	BU005	500ml	2500
pH buffer 7.0	BU006	500ml	2500
pH buffer 10.0	BU0010	500ml	2500

Key Highlights

The utility of HiMedia buffers extends beyond simple calibration; they are vital for the following:

- **Uniform Performance:** Formulated with ultrapure water to prevent contamination, ensuring accurate, repeatable measurements in the lab or the field.
- **Calibration:** Provides the precise reference points needed to validate slope and offset, keeping your electrode within the optimal ±30mV performance window
- **Long-Term Accuracy:** Every batch undergoes rigorous quality testing and lot-release criteria to ensure your buffer stays within specification.

Validation

- To ensure the integrity of your measurements, the validation of both the buffer and the instrument is required:
- Each batch of HiMedia buffer is verified using NIST (National Institute of Standards and Technology) primary reference materials, ensuring the accuracy of the labeled pH value.

Best Practices

- **Verification Checks:** Users should periodically perform a "verification" by measuring the buffer as an unknown sample.
- **Temperature Compensation:** Since pH is temperature-dependent, validation involves using the Certificate of Analysis (CoA) to cross-reference the actual pH value at the specific temperature of the laboratory (e.g., pH 7.00 at 25°C might be 7.02 at 20°C).
- **Contamination Control:** Never pour used buffer back into the original bottle. To validate that your stock is uncontaminated, always decant a small volume into a secondary fresh container for single-use calibration.

Skill Development Modules

Skills strengthen you

… You strengthen India ~ Narendra Modi

Innovation begins with the right choices and innovators need to be equipped with the right skills. It has been HiMedia's endeavor to promote science and technology in the field of life science. While working in pursuit of this endeavor, we have identified that there are extra skills required by the industry. Graduates and post graduates need to be equipped with these skills when they step out of their educational institutions. We, at HiMedia understand this and hence are launching a Skill Development Program to groom our budding scientist for the industry.

We have divided the program in to two modules, one on basic skills required in animal cell culture and second an advanced program for higher applications used in Biopharma, Cell therapy and Regenerative medicine, Drug discovery, Vaccine industry etc.

CleriGel Ultra®

- CleriGel® Ultra, an agar substitute is a highly purified, natural anionic heteropolysaccharide produced from a bacterial substrate composed of glucuronic acid, rhamnose and glucose.
- It produces a clear, colorless gel with high strength which aids in visual detection of rooting pattern in the plants.
- CleriGel® Ultra produces agar like gels at approximately half the required quantity of agar, in the presence of soluble salts.
- Unlike agar, gel strength of CleriGel® Ultra is not affected over a wide range of pH and is free of phenolic contaminants.
- It is chemically inert to most of the biological growth additives. Moreover, microbial contamination is easily detected with CleriGel® Ultra at an early stage as compared to agar.
- CleriGel® Ultra is the finest grade of CleriGel and yields ultra transparent gel at a concentration of 2 - 2.5g/l depending on the type of plant species.

Gelling Agents

Plant Tissue Culture takes place in three-dimensional space. Callus cells, singly or in very small clusters, can be grown in liquid media, but for shoots to extend up and then roots to penetrate, a semi-solid gel surface is needed. This necessity warrants the use of gelling agents, as an important component of the medium.

The primary reason to use gelling agents is to create a semi-solidified media gel providing proper anchorage to the cultures. The gelling agents also have inherent physical and chemical properties of controlling the movement and availability of water and ions in the matrix, thus contributing to osmotic potential of the medium.

The choice of gelling agent may change with the stage of micropropagation and can influence growth of the culture. Both purity and cost of the gelling agent are important factors in any research or production operation.

HiMedia offers a wide range of gelling agents with at par quality, clarity and gelling strength which includes Agar Ultra Pure, Agar Technical Grade, CleriGel® Ultra, CleriGel® Super, CleriGar™ and Carrageenan.

The Gel strength of the gelling agents is tested using calibrated gel strength tester machine, TAXT Express standard texture analyzer as well as by assessing firmness of the gel.

Plant Growth Regulators

Plant hormones or plant growth substances are naturally occurring chemicals within plant tissues, which play a regulatory function in growth and development of a plant. These are usually synthesized in certain part of the plant and moved through the plant from one part to another. Chemicals prepared synthetically or through fermentation processes, which mimic the action of naturally occurring growth substances and have an ability to modify plant growth in some way, are termed as plant growth regulators.

The five major classes of Plant Growth Regulators are Auxins, Cytokinins, Gibberellins, Polyamines and Abscisic acid. Each of the growth regulator has a specific role and function which can be used to promote various physiological processes like callus induction, somatic embryogenesis, root formation, inhibition of axillary bud, cell elongation/ division, regulation of organogenesis, soma clonal variation, seed germination etc. Each response is often the result of two or more regulators acting together. Auxins and Cytokinins are by far the most commonly used regulators and usually form an integral part of nutrient media.

Contamination Control Systems

Avoidance or prevention of microbial contamination in plant tissue culture is critical. Microbial contamination is one of the major challenges in Plant Tissue Culture. Microorganisms infecting plant tissue culture leads to depletion of nutrients in the medium and reduces chances of survival of the plant culture.

To counter the contamination issues, HiMedia offers a wide range of antimicrobials including antibiotics, antifungals and selection agents. Our proprietary products like Phytapro® and antimicrobial supplement are broad spectrum biocide and have been specially designed for use in plant tissue culture.

The potential of antibiotics as selection agents has been very well realized in plant transformation systems and we provide a wide range of important selection agents including Hygromycin B, Kanamycin, Timentin, neomycin etc.

PLANT TISSUE CULTURE TESTED CHEMICALS

HiMedia is one of the foremost supplier of comprehensive range of plant tissue culture tested chemicals and biochemicals. The complete range of plant tissue culture tested chemicals are assessed analytically for chemical parameters along with specific plant tissue culture tests in order to verify their suitability in specific applications.

Many users prefer to design their own formulations, keeping this requirement in mind, we offer a wide range of chemicals including macroelements, microelements, amino acids, carbohydrates, vitamins and organic supplements.

All our products undergo stringent quality control required to maintain consistency and quality. We have developed in-house testing criteria for all our products and have defined release criteria. The routine testing protocol includes parameters such as:

Quality Parameter	Description
Appearance	Individual product is tested for Color, Texture, Nature, Consistency
Solubility	Individual product's solubility is tested in the solvents that they are soluble in
FTIR	Infrared absorption and emission spectra are measured and are matched with the standard spectrum
Assay	Qualitative/ Quantitative measurement of the analyte is done by carrying out different kinds of assays
Melting Range	Purity of a substance and amount of impurities present in a sample is determined

Higronics® ideas to grow

Introduction

Hydroponics, the technology of growing plants without soil, has gained popularity in India only in the past decade. The origin of hydroponics dates back to 19th Century, and since then, it has evolved such that, with advanced resources and technological intelligence, it has become possible to grow plants anywhere in the world, irrespective of the terrain and, for the matter of fact, crops can be grown even in space.

This technology has optimized space in the current agricultural set up, and has also reduced the consumption of fresh water (requires only 10% water as compared to conventional farming) and increased the quality of yield even in arid regions, thus bringing economic stability. Hydroponics, as a technology, has limited terrestrial biodiversity loss through reversion of large tracts of current stressed farmlands into sustainable and fundamentally natural environments.

If you want to grow the biggest, juiciest, yummiest plants you can possibly imagine, then hydroponics is the right choice of farming technology for you.

Philosophy

HiMedia® ventured into hydroponics in 2016 with a mission of sustainability, social responsibility, and most importantly, bringing about the much-needed change for the benefit of all. Our philosophy is built around the fundamentals of social upliftment through innovation and education, and thus began the journey of Higronics®.

From a humble start as a hydroponics company, to launching our first product, our major focus has always been to excel in product expertise, along with delivering an exceptional first of its kind experience to our customers. The higronics® platform is a One Point Solution (OPS) for all scales of hydroponics applications. We are thankful to our clients for being a part of this exciting journey.

We are sure that your support and encouragement will grow exponentially in the years to come.

Media Based Systems

Cocopeat Based Systems

Cocopeat Based Systems are very economical and easy to install. Cocopeat substrate allows increased aeration, thus giving increased yield & better quality of produce.

Single Planter Growbag System

This system includes our strong and UV Stabilized growbags, which are prefilled with either cocopeat or, a mixture of cocopeat and perlite. These are widely used to grow tomatoes and cucumbers, and are mainly used for climbers and creepers.

Minimum area for commercial cultivation: 500 square meter

Trough System

Our trough system gives the cultivator more control over growing medium. They have a longer life and can last for about 5-6 years. These are easy-to-install systems and are widely used in Greenhouses and Net houses.

Minimum area for commercial cultivation: 500 square meter

Multiplanter growbags

These are ready-to-use grow bags. They are durable; UV stabilized and can be used for a minimum of 2-3 years, depending upon the handling and extent of usage.

Minimum area for commercial cultivation: 500 square meter

Vertigrow system

These systems use our insulated pots designed for high density vertical farming. They are popular for usage in strawberry cultivation and for production of leafy vegetables.

Minimum area for commercial cultivation: 500 square meter

Hydroton Based Systems

The Dutch Bucket systems or Bato Bucket systems are a durable & sustainable method of hydroponic farming. This system conserves large amount of water & nutrients, thus saving substantial amount of resources.

Dutch Bucket

Combination of Hydroton, LECA or Perlite in our Dutch bucket is a perfect blend for growing any creeper vegetables with high crop values. These systems are normally used for growing crops like tomato, cucumber and capsicum.

Minimum area for commercial cultivation: 500 square meter

Water Culture Systems : NFT Systems

Nutrient film technique (NFT) is a hydroponic technique where a thin stream of water containing all the dissolved nutrients required for plant growth is re-circulated past the bare roots of plants in a gully, also known as channels. NFT systems require lesser water and consume less amount of nutrients. They avoid the supply, disposal and cost problems associated with media based systems. NFT systems are relatively easy to disinfect roots and hardware compared to other system types. The absence of medium makes it easy to inspect roots for signs of disease, feed adequacy, etc. NFT systems are the best systems for leafy vegetables. A-Shape NFT provides more planting footprint per sq. meter area and this usage of 3 dimensional spaces gives a very high yield per acre.

Horizontal NFT

NFT system can work in either horizontal or vertical setups depending on the grow space and the types of plants you wish to grow (like trying to grow vertical stacks of tomatoes would be difficult).

Minimum area for commercial cultivation: 500 square meter

Vertical NFT A-Shape

A-Shape NFT provides more planting footprint per sq. meter area. This design offers optimum 3 dimensional space utilization, thus providing maximum yield per acre.

Minimum area for commercial cultivation: 500 square meter

Indoor Hydroponics with NFT Systems

The 'City Farming' revolution starts here. This cultivation process involves growing crops/plants in small indoor areas using multi-storied stacks to maximize production. All the required elements that influence healthy plant growth can be easily controlled and maintained. These include factors like light, temperature, humidity, pH levels, nutrients and water. The ability to control these elements makes hydroponic gardening easier and less time consuming against conventional soil gardening.

NFT systems provide a recurring flow of nutrient solution without the use of a timer (unlike aeroponic system). Rather, the roots of plants hang down in the solution and plants absorb the necessary nutrients from the flowing stream of nutrient solution.

Indoor hydroponics is a beautiful combination of technology and aesthetic beauty which not only saves up on cost, space and manual labour, but also looks beautiful and contributes to your overall health and well-being. Your indoor house setups are incomplete without a small hydroponics system. Who would have known living in the modern times could be so exciting!

Centrifuge Tubes# Autoclavable

A nomogram can be used to derive the rpm setting for your centrifuge.

1) Measure the radius (cm) from the center of the centrifuge spindle to the end of the test tube carrier. Mark this value on scale A.
2) Mark the relative centrifugal force (e.g. 400) on scale B.
3) With a ruler, draw a straight line between points on columns A & B, extending it to intersect column C. The reading on column C is the RPM setting for the centrifuge.

Flapping Homogenizer (Stomaker)

- Flapping Homogenizer is also called Sterile Homogenizer, can be use to abstract bacteria from solid samples. Put the original samples and the diluents into the sterile bag, then put the bag into the homogenizer, through the flapping of the paddles, the material in the bag can rapidly reach a homogenized state by the pressure, shaking and vibration.
- To guarantee the uniformity of the effective extraction of the microorganism inside and on the surface of the solid sample, make sure to include all the material in the sterile bag. The homogenized sample then can be used for the following analysis, the sterile bag avoids the cross contamination.
- Using disposable sterile homogeneous bags to guarantee the sample safety and non-contamination, leakless process omits cleaning of the instrument. The advantage of the flapping homogenization is convenient, quick, mild, accurate and good repeatability. Samples will not be contaminated, damaged, heated, and no sterilization as well as no container is needed, thus no container cleaning process either.

Applications:

Food microbiological analysis

Homogenization of animal tissues, biological samples, and cosmetics

Homogenization of meats, fish, vegetables, and fruits

Medicines, clinics, molecules, detection of toxins and bacteria

Flapping Homogenizer Door Design: SS-Door With Observation Window Capacity Range: 50-400 mL Flapping Speed: Fixed to 8 times / Sec Exterior Size (LxWxH) (W x D x H, cm): 45 x 21 x 24 Interior Size(W x D x H, cm): 10 x 19 x 22	**LA1082-1NO**	**1no**	**On request**

Qualitative Filter Papers

Standard Grades (Non-Wet-Strengthened)

Standard qualitative filter papers are suitable for quadrant folded or gravity flow applications. These grades contain a high level of alpha-cellulose that provides high purity but weakens when wet. The inherent strength of standard (untreated) grades does not pose a problem when they are used in routine quadrant folded applications. We do not recommend these grades for use in vacuum work or when wet handling is required.

601 equivalent to Grade 1

HiMedia 601:11µm - Medium speed

This grade covers a wide range of laboratory applications and is used for clarifying liquids and for rapid filtration of coarser precipitates such as lead sulfate, lead chromate, calcium oxalate, calcium carbonate, aluminium phosphate, barium carbonate and beryllium hydroxide. HiMedia 601 can be used in soil analysis, seed testing and in air pollution to collect dust-laden air. It is also commonly used in the food industry to separate foodstuffs from associated liquid or extracting liquid.

642 equivalent to Grade 2

HiMedia 642 : 2µm - Medium Speed

The grade has finer particle retention than HiMedia 601 but with slightly lower filtration speed. HiMedia 642 also has higher absorption than HiMedia 601. It is used in general laboratory application to retain particles above 2µm in size. HiMedia 642 can be used in agricultural and environmental laboratories for plant growth trials, soil testing, air analysis for monitoring specific contaminants and in the filtration of organic and sulfide precipitates.

Wet-Strengthened Grades				
Qualitative wet-strengthened grades are manufactured for applications using filter paper in a system or apparatus that operates under pressure or vacuum conditions. These systems require the use of extremely strong filter paper such as those in HiMedia's Binder Series. These grades contain a small amount of chemically stable, insoluble binding resin that strengthens the natural fiber-to-fiber bonds under wet conditions. Grades containing wood fibers or resins containing nitrogen, are not recommended for use in quantitative ashing techniques and in kjeldahl estimations. HiMedia's qualitative wet-strengthened filter papers are also used in industrial laboratories where techniques require a strong and economical filter paper with consistent quality and performance.

Hardened Filters (Hardened Ashless Grades) (Ash 0.006%)

These specially treated hardened ashless grades are available for critical quantitative analytical techniques requiring increased wet-strength and handling capacity. These high purity filter papers have a tough, smooth surface free of loose fibers and are ideal for collecting wet precipitates. Each grade offers a convenient combination of particle retention and flow rate and are generally used because of their high chemical resistance to strong acid and alkali.

Students Grade Filter Paper or General Laboratory Filtration Methods and Qualitative Analysis Papers

Standard Grades (Non Wet-Strengthened)

These filter papers are comparable to non wet-strengthened standard grade filter papers suitable for quadrant folded or gravity flow applications. These grades contain a high level of alpha-cellulose that provides high purity but will weaken when wet. The inherent strength of standard (untreated) grades does not pose a problem when they are used in routine quadrant folder applications. We do not recommend these grades for use in vacuum work or when wet handling is required.

HiMedia 613 : For Asphalt and Sugar testing

This is a strong filter paper with a medium flow rate and retention. HiMedia 613 is commonly used in student laboratories. This strong general purpose filter is also used in Buchner funnels for barium carbonate, lead chromate and beryllium hydroxides. It can also be used for Asphalt Testing and Sugar Testing.
